CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB The invention provides a composition of matter of the formula (I):  
V--L--R where V is an organic group having binding affinity for an

angiotensin II receptor site, L is a linker moiety or a bond, and R is  
a moiety detectable in in vivo **imaging** of a human or animal  
body, with the provisos that where V is angiotensin or a peptidic  
angiotensin derivative or analog then V--L--R is other than a non-metal  
radionuclide substituted peptide (e.g. .sup.125I substituted  
angiotensin  
II) and L--V is other than simply a peptide with a chelating agent  
amide  
bonded to a side chain thereof. This composition of matter may be used  
to image cardiovascular diseases and disorders.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB Microbubble dispersions stabilized by **phospholipids** predominantly comprising molecules which individually have an overall net charge exhibit advantageous stability, rendering them useful as efficacious contrast agents. An improved process for preparing microbubble-containing contrast agents is also disclosed, this comprising lyophilising an aqueous dispersion of gas microbubbles stabilized by one or more membrane-forming lipids to yield a dried product which may be reconstituted in an injectable carrier liquid to generate a microbubble-containing contrast agent.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

 AB The present invention relates to contrast agents comprising  
 gas-containing or gas-generating polymer microparticles and/or  
 microballoons, in which the polymer is a biodegradable polymer

containing units of formula  $[-(O).sub.m -CO-O-C(R.sup.1 R.sup.2)-O-CO-(O).sub.n -]$  . R.sup.1 and R.sup.2 each represent hydrogen or a carbon-attached monovalent organic group, or together form a carbon-attached divalent organic group, and m and n are each independently zero or one. The contrast agents may be used in diagnostic applications such as ultrasound and **MR imaging**.

AB The invention provides a diagnostic composition for administration to human or animal subjects, the composition containing multilamellar liposomes, optionally together with unilamellar liposomes, the liposomes

containing at least one **imaging** agent and being suspended in an aqueous medium containing said **imaging** agent, wherein the liposomes comprise a neutral **phospholipid** and a charged **phospholipid**, the average particle diameter of the liposomes is 50-3000 nm and the concentration of **imaging** agent in any aqueous phase filling the interior of the liposomes is substantially the

same as that in the aqueous medium in which the liposomes are suspended.

The contrast agents concerned are typically X-ray, **MRI** or ultrasound contrast agents.
